Candida Comparative And Functional Genomics

All Candida species fall within the hemiascomycete group, which contains most of the known yeast species (see Candida: Comparative and Functional Genomics). An emblematic representative of the hemiascomycete group is the yeast *Saccharomyces cerevisiae*, which has become one of the main models for the study of eukaryotic organisms.

A functional and cell biological analysis of Kre5p was conducted to further elucidate the role of this diverged protein glucosyltransferase-like protein in β -1,6-glucan synthesis. Kre5p was found to be a primarily soluble N-glycoprotein of \approx 200 kDa, that localizes to the endoplasmic reticulum.
