

canine parvovirus a new pdf

Canine parvovirus type 2 (CPV2, colloquially parvo) is a contagious virus mainly affecting dogs, and thought to originate in cats. The current consensus is that the feline panleukopenia virus mutated into CPV2. Parvo is highly contagious and is spread from dog to dog by direct or indirect contact with their feces. Vaccines can prevent this infection, but mortality can reach 91% in untreated cases.

Canine parvovirus - Wikipedia

Where Did Parvovirus Come From?. Although dog parvovirus is a relatively new disease, cats have always had their parvovirus - We call it panleukopenia. Related parvovirus affect many other animals as well (including mink, cows, pigs and humans). However, most parvovirus are choosy about the animal species they attack.

The American Animal Hospital Association (AAHA) recently issued its 2011 Canine Vaccination Guidelines. The 2003 report, revised in 2006 and 2007, caused quite a stir. Many veterinarians and pet parents didn't trust the findings "and still don't" even though the report was backed by scientific studies and written by 14 well-respected experts.

Programs supporting regular feline vaccination have contributed both to the health of cats and to public health.. Currently, there are geographically defined core vaccines and individually chosen non-core vaccine recommendations for cats. A number of controversies surrounding adverse reactions to vaccines have resulted in authorities revising their guidelines for feline vaccination.
