A database is an organized collection of data, generally stored and accessed electronically from a computer system. Where databases are more complex they are often developed using formal design and modeling techniques.. The database management system (DBMS) is the software that interacts with end users, applications, and the database itself to capture and analyze the data.

There has been a lot of debates around when to use stored procedures vs. raw sql. Many purists are vehemently on one side of the fence or the other. Strangely people talk about views to a lesser extent. Stored functions and triggers are almost nonexistent in these debates. In this article we'll try to provide a non-biased outline of the benefits and pitfalls of each approach.

In computing, Open Database Connectivity (ODBC) is a standard application programming interface (API) for accessing database management systems (DBMS). The designers of ODBC aimed to make it independent of database systems and operating systems. An application written using ODBC can be ported to other platforms, both on the client and server side, with few changes to the data access code.
