Just Enough Operating System (JeOS, pronounced "juice") is a paradigm for customizing operating systems to fit the needs of a particular application such as for a software appliance. The platform only includes the operating system components required to support a particular application and any other third-party components contained in the appliance, (e.g., the kernel).

Preamble. How we approach architecture, defines what architecture, in effect, is, at least for our system. That is, no matter what we say architecture is (for), architecture is (an outcome of) what we do. This is a POSIWID (the purpose of a thing is what it does -- Stafford Beer) kind of point, noting that what the thing does, trumps what we may think it is and ought to do.

Figure 2: While each project can have a unique set of risks, it is possible to generalize by domain.

Prototypical risks are ones that are common in a domain and are a reason that software development practices vary by domain.

Although this would appear to satisfy the conditions outlined in What is a "tier"?, I feel that it fails on one important aspect. Just as a layer cake is made up of several layers of cake - you cannot combine a single piece of cake, a cake stand and a decoration and call it a "layer cake" - you require several layers of "cake".
