Solubility is the property of a solid, liquid or gaseous chemical substance called solute to dissolve in a solid, liquid or gaseous solvent. The solubility of a substance fundamentally depends on the physical and chemical properties of the solute and solvent as well as on temperature, pressure and presence of other chemicals (including changes to the pH) of the solution.

In chemistry, a pyrophosphate is a phosphorus oxyanion. Compounds such as salts and esters are also called pyrophosphates. The group is also called diphosphate or dipolyphosphate, although this should not be confused with phosphates. As a food additive, diphosphates are known as E450. A number of hydrogen pyrophosphates also exist, such as  $\text{Na}_2\text{H}_2\text{P}_2\text{O}_7$ , as well as the normal pyrophosphates.

Chapter 6.9 Mercury General description Mercury exists in three oxidation states:  $\text{Hg}^0$  (metallic),  $\text{Hg}^+$  (mercurous) and  $\text{Hg}^{++}$  (mercuric) mercury. The latter forms a variety of inorganic as well as organometallic compounds.

2 It is important to note that the balancing of an equation is accomplished by placing numbers in front of the proper atoms or molecules and not as subscripts. In an equation, all chemical species appear as correct formula units. The addition (or change) of a subscript changes the meaning of the formula unit and of the equation.

Properties of some particular solutions 2 Annex 1. Salt water solutions We study here basically aqueous solutions of common salt ( $\text{NaCl}$ ,  $M = 0.023 + 0.0355 = 0.0585 \text{ kg/mol}$ ), i.e. M water / sodium-chloride liquid mixtures, called brines.
